

Learn by doing.

A learning companion that gives people one doable next step, wherever they are.

Mobile practice • Desktop guidance • AI when the question appears

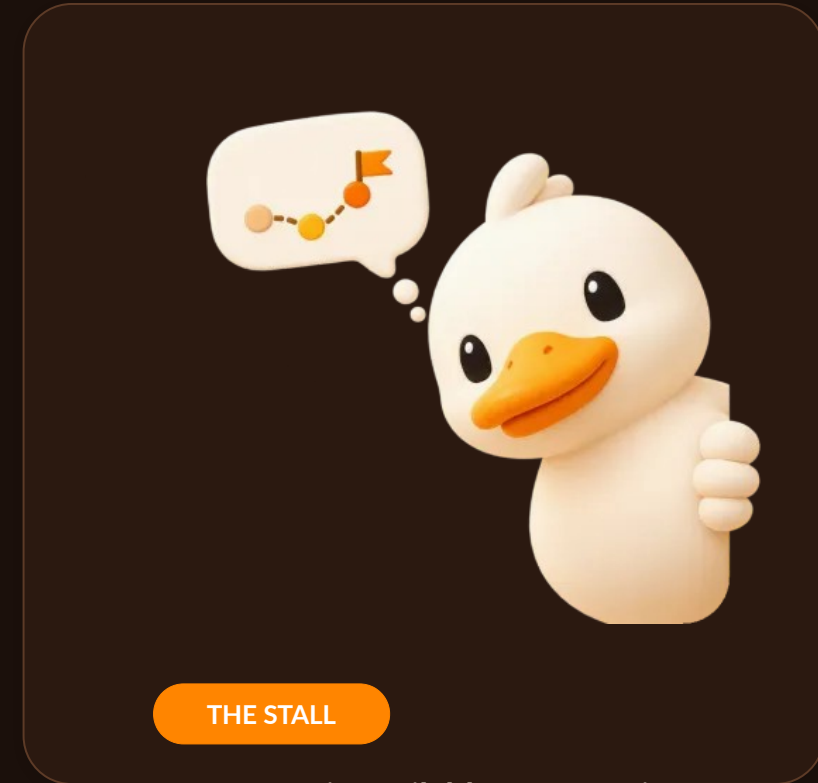

Learning support disappears when the learner is ready to act

The hardest moment often comes after the video ends.

“I know what I want to learn. I just do not know what to click next.”

The learner is alone when the question appears: late at night, between classes, or inside unfamiliar software.

Content is available. Context is missing.

The campus signal

Early conversations at Horus University pointed to the same friction from different angles.

Students do not only need more content. They need a safe next step.

AVAILABILITY

Instructor support stops when the learner's question starts.

ANXIETY

Some learners avoid asking because the question feels too basic or too late.

ACCESS

Courses can feel expensive, crowded, or disconnected from the moment of practice.

OBSERVED

Qualitative themes from campus conversations. Add the verified participant count before presenting.

The missing layer is contextual guidance

Bataa helps at the exact moment the learner has to make a move.

CONTENT ONLY

Watch → pause → search → stall

The learner has to translate theory into the next action alone.

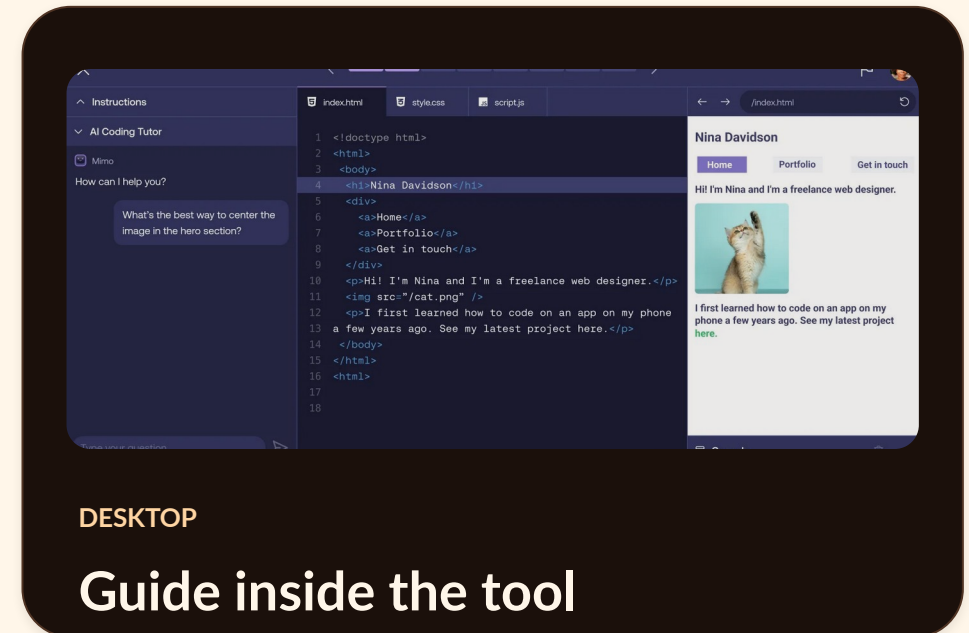

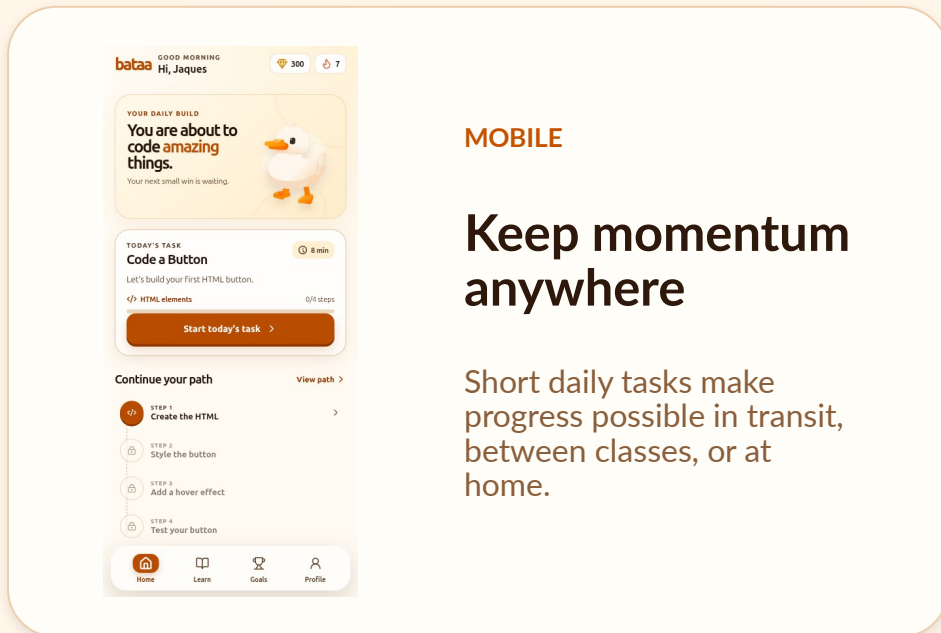

BATAA

Try → get feedback → keep moving

The next step appears beside the work, in plain English.

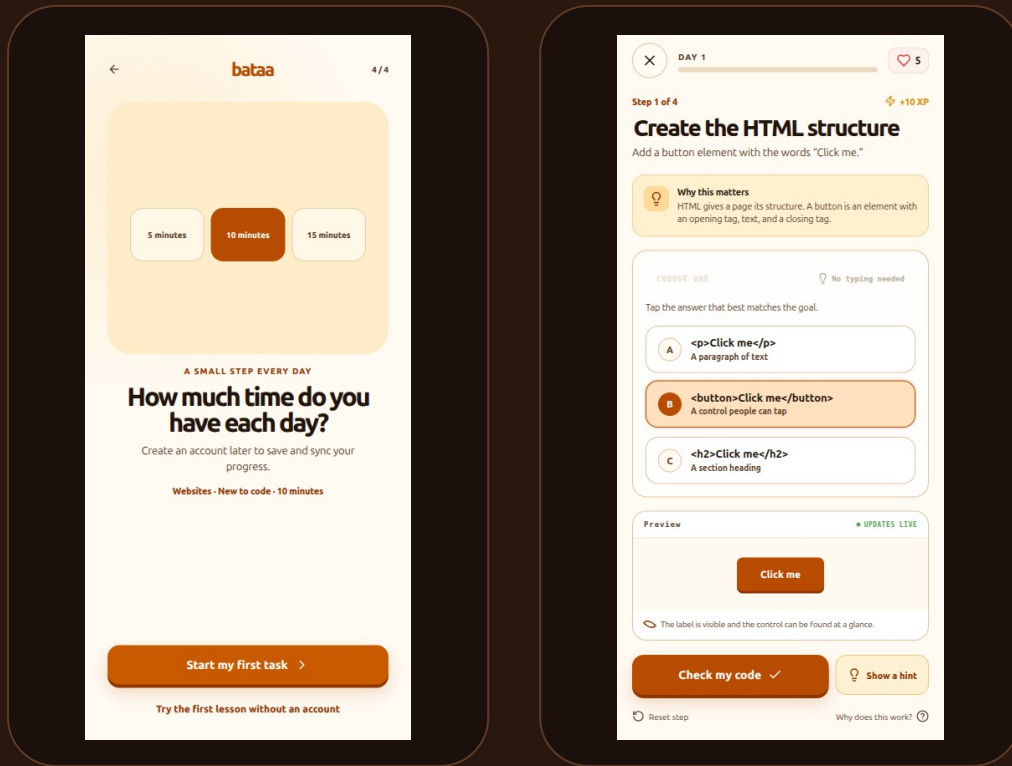

One product, two moments

The same learning loop follows the learner from a spare minute to the tool where the work happens.

Mobile turns spare minutes into practice

A daily task can fit into the time a learner already has.

1

8–10 min

A small session with a clear finish line

2

No typing needed

The first days use three-choice recognition

3

One real skill

Every step maps to a usable web concept

Desktop guidance meets the learner where work happens

For 3D, code, and other tools, Bataa can point to the next action instead of describing it from a distance.

```
chars = sorted(list(set(''.join(words))))  
stoi = {s:i+1 for i,s in enumerate(chars)}  
stoi['.'] = 0  
itos = {i:s for s,i in stoi.items()}
```

AI Explanation

```
itos = {i:s for s,i in stoi.items()}
```

This code is creating two dictionaries for character-to-integer and integer-to-character mappings.

What are dictionaries?

01

Notice

Understand what the learner is trying to do

02

Point

Highlight the exact control or line to inspect

03

Try

Let the learner perform the action and see the result

DEMONSTRATED

Autonomous control and deeper integrations are pilot work, not a promise of the current build.

A skill compounds one small day at a time

Illustrative 3D-modeling journey: the learner starts with a gesture, then builds a real artifact.

The product promise is a path, not a single lesson.

1

DAY 1

Find the tool

Recognize the viewport, select an object, make one change.

2

DAY 7

Shape a scene

Combine small actions into a simple modeled composition.

3

DAY 30

Finish an artifact

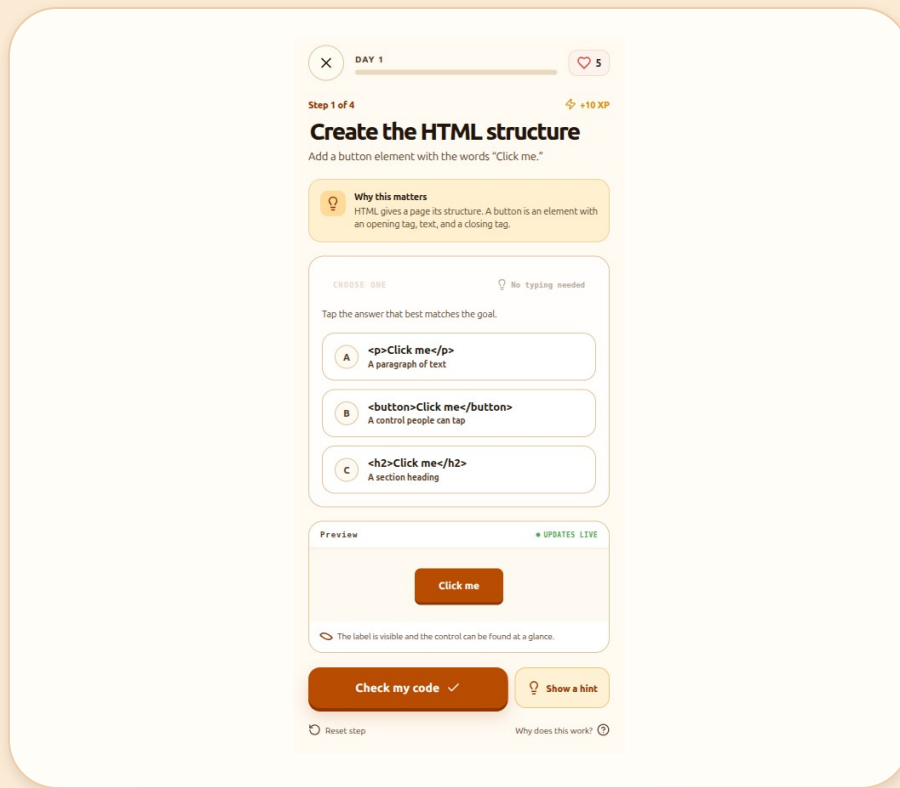

Use the same guided loop to complete portfolio-ready piece.

ILLUSTRATIVE

Replace with a real Bataa skill path and learner artifact before the final pitch.

The first three days should feel approachable

Recognition first. Typed code comes after the learner understands what the code is doing.

**DAY 1****Choose the right HTML element****DAY 2****Match CSS properties to a visual result****DAY 3****Predict what a hover state will do**

The learner gets a win before they get a keyboard-heavy challenge.

Bataa closes the gap between attempt and understanding

Each turn makes the next turn easier.

THE LOOP

The product keeps the learner moving without taking the work away from them.

Bataa sits between content and the moment of action

A positioning hypothesis, not a claim that competitors lack AI.

Bataa combines daily practice with help inside the work.

VERIFY BEFORE PRESENTING

Start with one clear revenue engine

Paid learning first. Optional AI usage and platform licensing expand the model later.

LAUNCH PRIORITY

Course purchase

Learners pay for a structured path that turns practice into a finished skill.

OPTIONAL

AI tokens

Extra attempts, deeper explanations, or advanced model usage.

LATER

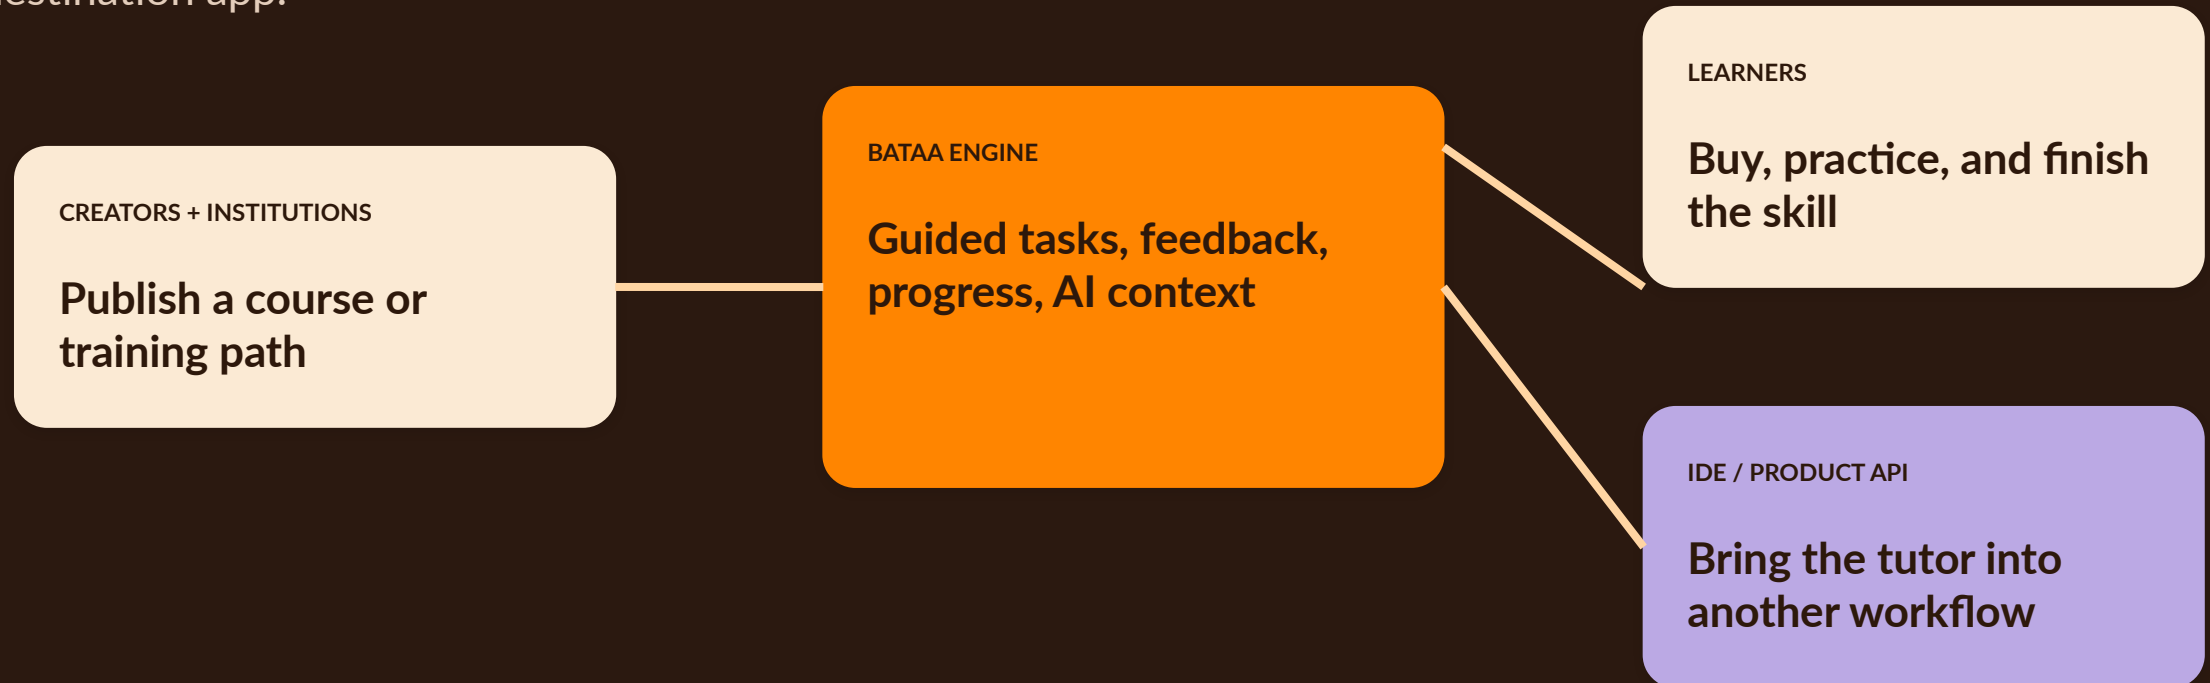

Platform fees

Commission from creator and institution courses.

Keep the first story simple: one learner pays for one useful outcome.

The same learning engine can serve creators and institutions

Bataa can become the infrastructure behind guided practice, not only a destination app.

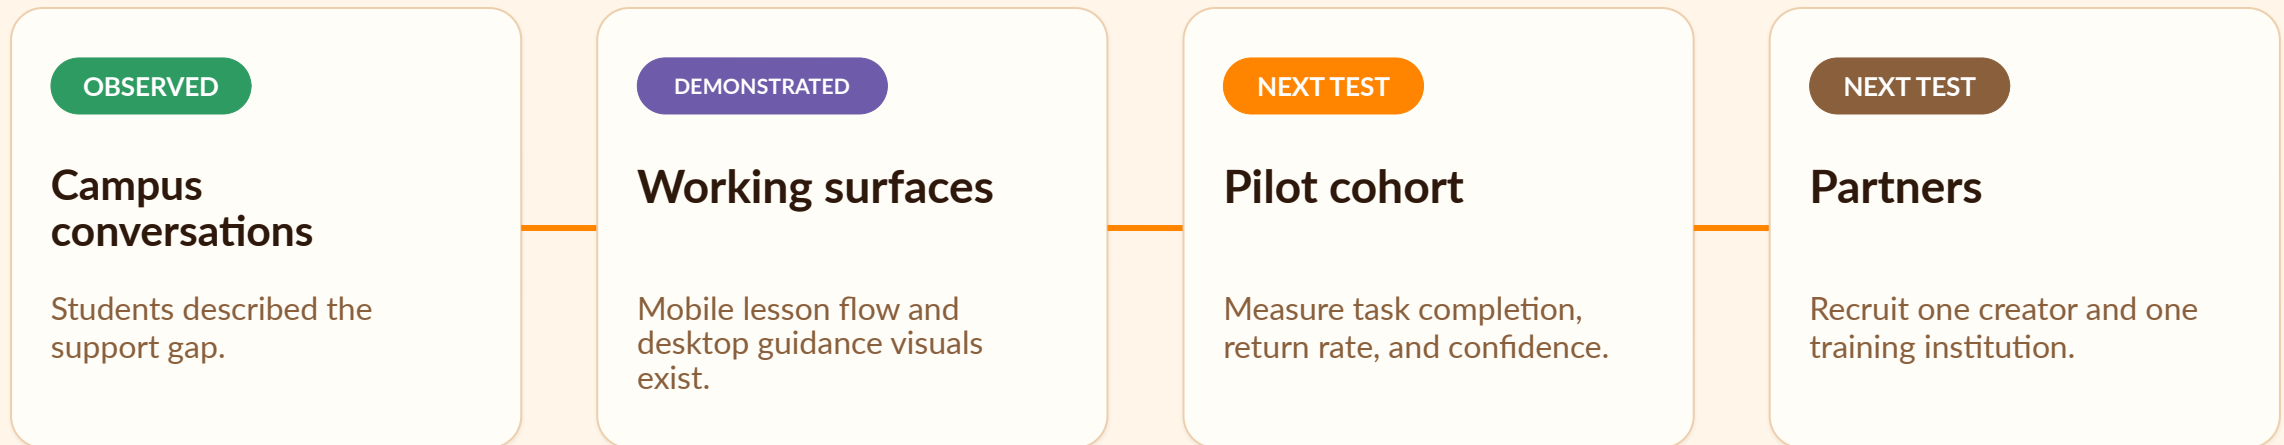

PLANNED EXPANSION

Commission on course sales plus API licensing for organizations and tools.

The first wedge is close to the learner

Start with campus communities, prove the learning loop, then widen the platform.

The next proof point is not reach. It is whether a learner returns because the next step felt doable.

The team built the core surfaces

The product is split across the places where the learner meets Bataa.

1

Abdelrahman Mohsen

DESKTOP APP

Builds the guided workspace where the AI can meet the learner inside real software.

2

Yousef

MOBILE APP

Builds the daily lesson loop for small, approachable practice sessions.

3

Mostafa

LANDING PAGE

Shapes the public story, visual identity, and first touchpoint for Bataa.

TEAM PROOF

Each role maps to a working surface already visible in the product.

The next milestone is a real pilot.

Prove that one doable action can become a habit and a finished skill.

01

Beginner mobile path

Ship the first week of simple daily tasks

02

Desktop agent pilot

Guide one real workflow with safe user control

03

Partner pilots

Test a creator course and an institutional path

OUR ASK

Pilot partners

One campus, one creator, and one training team willing to measure the loop with us.

Bataa gives every learner a next step.

FOLLOW THE BUILD

Keep building with Bataa

Follow product updates, new lessons, and the next Bataa launch.
